

AN AUXILIARY APPARATUS FOR MOBILE PHONE

ABSTRACT

An auxiliary apparatus comprises a rotating base, a base and a buckling piece with a long arc strip shape. The rotating base is pivoted on a bottom of the base. The bottom surface of the rotating base is adhered on a case of a mobile phone via a twin adhesive. One end of the buckling piece is connected to the base, and another end is buckled on a head of a human being via the arc shape of the buckling piece. The auxiliary apparatus makes the mobile phone firmly fixed aside of an ear of the human being without handholding.
